OPTICALLY ACTIVE PYRIDONECARBOXYLIC ACID DERIVATIVES

FIELD OF THE INVENTION

This invention relates to an antimicrobial compound useful as human and veterinary medicines, fish
5 medicines, agricultural chemicals, and antiseptics.

BACKGROUND OF THE INVENTION

10 Quinolone derivatives having a condensed pyridonecarboxylic acid skeleton are known as synthetic antimicrobial agents and to provide potent antimicrobial compounds on substitution of the 1-position thereof with a cyclopropyl group.

15 It is further known that the 1-cyclopropylquinolone derivatives having introduced a fluorine atom to the 2-position of the cyclopropyl group in a cis-configuration with the pyridonecarboxylic acid moiety also exhibit potent antimicrobial activity as disclosed in JP-A-87-12760 (the term "JP-A" as used herein means an "unexamined published Japanese patent application"). They are thought to have not only potent antimicrobial activity but improved safety. One example of the quinolone derivatives having a cis-fluorocyclopropyl group at the 1-position is shown below.

20

30 Quinolone derivatives having a cis-halogenocyclopropyl group, inclusive of a cis-fluorocyclopropyl group, at the 1-position as stated above possess excellent properties in antimicrobial activity and safety. In these compounds, even when they have a substituent without stereo-isomerism at the 7-position of the pyridonecarboxylic acid moiety, the halogenocyclopropane ring of itself provides two enantiomers attributed to the steric relationship between the pyridonecarboxylic acid moiety and the halogen atom with respect to the cyclopropane ring as illustrated below:

50 wherein R¹, R², A, X¹, and X² are hereinafter defined. These quinolone derivatives are applicable as medicines as long as they are racemates. On the other hand, when there is stereoisomerism at the 7-positioned substituent of the pyridonecarboxylic acid moiety, such quinolone derivatives contain four kinds of diasteromers. With mixtures of the diasteromers, it is difficult to specify the excellent species and to supply them as medicines.

SUMMARY OF THE INVENTION

In the light of the aforesaid situation, the inventors have made extensive efforts to obtain the single
 5 isomers of 1-(1,2-cis-2-fluorocyclopropyl)-substituted quinolone derivatives within the diastereomers thereof.
 And they have succeeded in obtaining each of the enantiomers of a cis-2-fluorocyclopropylamine as a pure
 isomer. As a result of further investigations, they have also succeeded in synthesizing each of the
 enantiomers of a quinolone derivative which are attributed only to the steric configuration of the
 fluorocyclopropane ring by starting from the above-described amine.

10 The success of obtaining the enantiomeric quinolone derivatives useful as an intermediate has made it
 possible to synthesize an optically active quinolone derivative comprising one kind of diastereomer by
 reacting with a single isomer of the amine at introduction of a cyclic amino group to the 7-position. Each of
 these diastereomers was proved more potent in antimicrobial activity as compared with the corresponding
 15 quinolone derivatives substituted with a mere cyclopropyl group and, in addition, highly safe with markedly
 improved selective toxicity. The present invention has been completed based on these findings.

This invention relates to an N-(1,2-cis-2-halogenocyclopropyl)-substituted pyridonecarboxylic acid
 derivative represented by formula (I):

wherein R¹ represents a substituted or unsubstituted amino group, a hydroxyl group, a thiol group, or a
 30 hydrogen atom; R² represents a substituted or unsubstituted cyclic amino group which may contain at least
 one hetero atom selected from a nitrogen atom, an oxygen atom, and a sulfur atom in its ring; A represents
 C-X³ or a nitrogen atom; X¹ and X², which may be the same or different, each represents a halogen atom;
 and X³ represents a halogen atom, an alkyl group having from 1 to 6 carbon atoms, an alkoxy group having
 35 from 1 to 6 carbon atoms, a cyano group, a trifluoromethyl group, or a hydrogen atom; provided that the
 case wherein R¹ is a hydrogen atom and R² is a piperazine or 4-alkyl-substituted piperazine residue is
 excluded, or a salt thereof.

Specifically implicit in the compounds represented by formula (I) and salts thereof are those wherein R²
 is a cyclic amino group which may be substituted; those wherein R² is a 4- to 7-membered cyclic amino
 40 group which may be substituted with a hydroxyl group, an alkyl group having from 1 to 6 carbon atoms, or
 a substituted or unsubstituted amino group; those wherein R² is a pyrrolidine, piperidine, piperazine,
 diazabicycloheptane or diazabicyclooctane residue; those wherein R² is a cyclic amino group comprising a
 single stereoisomer; those wherein R² is a 3-aminopyrrolidinyl group; those wherein R² is a 7-amino-5-
 45 azaspiro[2,4]-heptan-5-yl group; and those wherein X² is a fluorine atom. More specifically, the compounds
 according to the present invention include 7-[3-(S)-amino-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-
 fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[3-(S)-amino-1-pyrrolidinyl]-8-chloro-6-
 50 fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[7-amino-5-azaspiro[2,4]-
 heptan-5-yl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 5-
 amino-7-[3-(S)-amino-1-pyrrolidinyl]-6,8-difluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-
 carboxylic acid, 7-[4-(S)-amino-2-(S)-methyl-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-
 55 dihydro-1,8-naphthyridine-3-carboxylic acid, 7-[3-(R)-[1-(S)-aminoethyl]-1-pyrrolidinyl]-8-chloro-6-fluoro-1-
 (1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[3-amino-4-methyl-1-
 pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-8-methoxy-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,
 7-[4-(S)-amino-2-(S)-methyl-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-8-methyl-4-oxo-1,4-
 dihydroquinoline-3-carboxylic acid, 5-amino-7-[7-amino-5-azaspiro[2,4]heptan-5-yl]-6,8-difluoro-1-(1,2-cis-2-
 fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, and salts thereof.

DETAILED DESCRIPTION OF THE INVENTION

In formula (I), when X^3 represents a halogen atom, X^1 and X^3 each preferably represents a fluorine atom or a chlorine atom; and X^2 preferably represents a fluorine atom. R^1 represents a substituted or unsubstituted amino group, a hydroxyl group, a thiol group, or a hydrogen atom, preferably an unsubstituted amino group, a methylamino group, or a hydrogen atom.

R^2 represents a cyclic amino group, preferably a 4- to 7-membered, and more preferably 5- to 6-membered cyclic amino group. The cyclic amino group may further contain oxygen atom(s), sulfur atom(s)- and/or nitrogen atom(s), as in oxazolidine, morpholine, thiazolidine, thiomorpholine, imidazolidine, pyrazolidine, and piperazine residues. Of these cyclic amino groups preferred are a pyrrolidine residue and a piperazine residue. The cyclic amino group may have substituents, such as a polar group (e.g., a substituted or unsubstituted amino group, a substituted or unsubstituted aminoalkyl group, a 5-substituted-2-oxo-1,3-dioxol-4-ylmethyl group, a hydroxyl group) and a straight chain, branched, or cyclic alkyl group having up to 6 carbon atoms. Preferred of the polar groups are an unsubstituted amino group, an aminomethyl group, a 1-aminoethyl group, and a hydroxyl group. Preferred of the alkyl group are methyl, ethyl, propyl, gem-dimethyl and gem-diethyl groups and further, these gem-alkyl groups may preferably form a cyclopropane or cyclobutane ring which is bonded through a spiro-union to the cyclic amine skeleton. The cyclic amino group further includes a bicyclic amino group composed of crosslinking to 4- to 7-membered cyclic amino groups.

Illustrative examples of these cyclic amino groups, particularly containing the second amino moiety, are shown below:

40 wherein R^3 , R^4 , R^5 , R^6 , which may be the same or different, each represents a hydrogen atom or an alkyl group having from 1 to 6 carbon atoms; R^7 , R^8 , and R^9 , which may be the same or different, each represents a hydrogen atom or an alkyl group having from 1 to 6 carbon atoms, provided that the case wherein R^7 , R^8 , and R^9 each represents a hydrogen atom and the case wherein R^7 and R^9 each represents a hydrogen atom and R^8 represents an alkyl group having from 1 to 6 carbon atoms are excluded; R^{10} and R^{11} , which may be the same or different, each represents a hydrogen atom or an alkyl group having from 1 to 6 carbon atoms; R^{12} and R^{13} , which may be the same or different, each represents a hydrogen atom or an alkyl group having from 1 to 6 carbon atoms, or they may be connected to each other to form a 3- to 6-membered ring composed of methylene chains; and the asterisk indicates an asymmetric center.

50 Examples of these cyclic amino groups are 3-aminopyrrolidinyl, 3-methylaminopyrrolidinyl, 3-dimethylaminopyrrolidinyl, 3-ethylaminopyrrolidinyl, 3-propylaminopyrrolidinyl, 3-isopropylaminopyrrolidinyl, 3-amino-4-methylpyrrolidinyl, 3-amino-5-methylpyrrolidinyl, 3-amino-4,5-dimethylpyrrolidinyl, 3-methylamino-4-methylpyrrolidinyl, 3-methylamino-5-methylpyrrolidinyl, 3-methylamino-4,5-dimethylpyrrolidinyl, 3-dimethylamino-4-methylpyrrolidinyl, 3-dimethylamino-5-methylpyrrolidinyl, 3-dimethylamino-4,5-dimethylpyrrolidinyl, 3-methylpiperziny, 4-methylpiperazinyl, 3,4-dimethylpiperazinyl, 3,5-dimethylpiperazinyl, 3,4,5-trimethylpiperazinyl, 4-ethyl-3,5-dimethylpiperazinyl, 4-isopropyl-3,5-dimethylpiperazinyl, 3-aminomethylpyrrolidinyl, 3-methylaminomethylpyrrolidinyl, 3-(1-amino)ethylpyrrolidinyl, 3-(1-methylamino)ethylpyrrolidinyl, 3-(1-ethylamino)ethylpyrrolidinyl, 3-(1-amino)propylpyrrolidinyl, 3-(1-

methylamino)propylpiperidinyl, 3-aminopyrrolidinyl, 3-amino-4,4-dimethylpyrrolidinyl, 7-amino-5-azaspiro[2,4]heptan-5-yl, 8-amino-6-azaspiro[3,4]octan-6-yl, 3,4-diazabicyclo[3.2.1]octan-3-yl, 9-methyl-3,9-diazabicyclo[3.2.1]octan-3-yl, and 9-ethyl-3,9-diazabicyclo[3.2.1]octan-3-yl.

The structure of the cyclic amino group at the 7-position have great influences on antimicrobial activity, 5 toxicity, oral absorption, and physical properties such as water solubility. For instance, it is known that quinolones substituted by 3-aminopyrrolidinyl groups have strong antimicrobial spectra against a broad range of microorganisms covering Gram-positive to Gram-negative bacteria. Some quinolone derivatives of this type, however, are susceptible to metabolism or only show low water-solubility.

3-Aminopyrrolidinyl groups having a spiro ring at the carbon atom adjacent to the amine group thereof 10 provide quinolone derivatives exhibit improved oral absorption rate and improved in vivo stability against metabolism while retaining potent antimicrobial activity. The compounds of this type have also been proved less causative of convulsion which is known as a side effect of quinolone type synthetic antimicrobials.

Further, 3-aminomethylpyrrolidinyl groups in which an amino group is bonded to a pyrrolidinyl group via 15 a carbon atom provide quinolone derivatives exhibiting enhanced antimicrobial activity against Gram-positive bacteria. In particular, the quinolones of this type in which the carbon atom linking the amino and pyrrolidinyl groups is substituted with one or two alkyl group(s) were found to exhibit improved oral absorption rate, safety, and water solubility over those without such substituent(s).

Additionally preferred as cyclic amino groups are piperazine residues, such as alkylpiperazine residues and piperazine residues having a spiro ring. 20

Examples of cyclic amino groups having substituents other than an amino group are 3-hydroxypyrrrolidinyl, 3-mercaptopyrrolidinyl, 3-hydroxy-4-methylpyrrolidinyl, 3-mercapto-4-methylpyrrolidinyl, morpholino, thiomorpholino, 2-methylmorpholino, 2-methylthiomorpholino, 2,6-dimethylmorpholino, 2,6-dimethylthiomorpholino, 2,2-dimethylmorpholino, and 2,2-dimethylthiomorpholino groups. 25

The cyclic amino group is bonded to the 7-position of the pyridonecarboxylic acid skeleton prefer ably at the nitrogen atom of the cyclic amino group. As a matter of course, it may be bonded at the other atom.

The stereoisomerism of the cyclic amine moiety at the 7-position is explained below. In cases where a 30 cyclic amine has isomers, if it is reacted in the form of an isomeric mixture with a 1-(1,2-cis-halogenocyclopropyl)quinolone derivative, the resulting quinolone derivative should be a mixture of diastereomers based on the steric relation with the 1,2-cis-2-halogenocyclopropyl group at the 1-position. In these cases, therefore, it is necessary that only one of the isomers of the starting amine should be reacted.

The functional group of the cyclic amino group at the 7-position such as amino, hydroxy and thiol groups may be protected by a conventional protective group prior to the substitution with the quinolone skeleton. The examples of such protective groups include alkoxy carbonyl groups such as t-butoxycarbonyl group, 2,2,2-trichloroethoxycarbonyl group and the like; aralkyloxycarbonyl groups such as benzyloxycarbonyl group, p-methoxybenzyloxycarbonyl group, p-nitrobenzyloxycarbonyl group and the like; acyl groups such as acetyl group, methoxyacetyl group, trifluoroacetyl group, chloroacetyl group, pivaloyl group, formyl group, benzoyl group and the like; alkyl or aralkyl groups such as t-butyl group, benzyl group, p-nitrobenzyl group, p-methoxybenzyl group, triphenylmethyl group and the like; ethers such as methoxymethyl group, t-butoxymethyl group, 2,2,2-trichloroethoxymethyl group, tetrahydrofuran-2-yl group and the like; silyl groups such as trimethylsilyl group, isopropyldimethylsilyl group, t-butyldimethylsilyl group, t-butyldiphenylsilyl group, tribenzylsilyl group and the like. 35

The 1,2-cis-2-halogenocyclopropyl group at the N₁-position is described below. Introduction of a halogen atom to the cyclopropyl group particularly a fluorine atom, brings about an effect to reduce lipophilicity of the whole molecule. It is known that drugs are more likely to be distributed to the central nervous system as lipophilicity thereof increases. In this connection, introduction of the 1,2-cis-2-halogenocyclopropyl group yields quinolones having reduced toxicity while retaining excellent antimicrobial activity as compared with the corresponding 1-cyclopropylquinolones. The halogen atom to be introduced includes fluorine and chlorine atoms, with a fluorine atom being preferred. 40

It is particularly preferable that the halogen atom and the pyridonecarboxylic acid moiety are cis with respect to the cyclopropane ring. Irrespective of whether the 7-cyclic amino group has stereoisomers or not, the quinolone derivatives of formula (I) have enantiometric pairs ascribed to the cis-2-halogenocyclopropyl moiety at the 1-position as illustrated below. Potent activity and high safety were observed in either of these enantiomers. 45

and

10

The pyridonecarboxylic acid derivatives according to the present invention include the respective free acids, acid-addition salts thereof, and the salts of the carboxyl group thereof. The acid-addition salts include inorganic acid salts, e.g., hydrochlorides, sulfates, nitrates, hydrobromides, hydroiodides, and phosphates; and organic acid salts, e.g., acetates, methanesulfonates, benzenesulfonates, toluenesulfonates, citrates, maleates, fumarates, and lactates.

15 The salts of the carboxyl group may be organic or inorganic and include alkali metal salts, e.g., lithium salts, sodium salts, and potassium salts, alkaline earth metal salts, e.g., magnesium salts and calcium salts; ammonium salts, triethylamine salts, N-methylglucamates, and tris(hydroxymethyl)aminomethane salts.

20 Some of these free acids and salts may exist as a hydrate.

Esterification of the carboxylic acid moiety of the pyridonecarboxylic acid derivatives of formula (I) gives compounds useful as synthesis intermediates or pro-drugs. For example, alkyl esters, benzyl esters, alkoxyalkyl esters, phenylalkyl esters and phenyl esters are useful as synthesis intermediates. Esters which are easily severed in the body to form free carboxylic acids are useful as pro-drugs. Examples of such esters are acetoxyethyl esters, pivaloyloxyethyl esters, ethoxycarbonyloxy esters, chlorine esters, 25 dimethylaminoethyl esters, 5-indanyl esters, phthalidinyl esters, and oxo-alkyl esters (e.g., 5-substituted-2-oxo-1,3-dioxol-4-ylmethyl esters and 3-acetoxy-2-oxobutyl esters).

A process for synthesizing the pyridonecarboxylic acid derivatives of formula (I) is illustrated below, taking the compound wherein A = C-H; R¹ = H; X¹ = X² = F; and R³ = Et (ethyl group, hereinafter the same) for instance.

30

35

40

45

50

55

30 wherein R⁴ has the same meaning as R² or a cyclic amino group having the same structure as R² but being protected.

An optically active 1-(1,2-cis-2-fluorocyclopropyl)-6,7-difluoro-1,4-dihydro-4-oxoquinoline-3-carboxylic acid ethyl ester (6a) or (6b) is hydrolyzed under acidic or alkaline conditions to give a free carboxylic acid derivative (7a) or (7b). The free acid (7a) or (7b) is reacted with a cyclic amine R⁴-H to obtain a desired compound (IIIa) or (IIIb). If necessary, a protective group is removed from the resulting compound under proper conditions selected according to the protective group to obtain a desired compound (IVa) or (IVb).

The substitution reaction with the cyclic amine can be carried out in a solvent such as dimethyl sulfoxide, pyridine, acetonitrile and 3-methoxybutanol, at a temperature of from room temperature to 150 °C, preferably from 40 to 120 °C, for 0.5 to 5 hours, usually from 0.5 to 2 hours.

40 Alternatively, the compound (6a) or (6b) is reacted with a cyclic amine under the same conditions as recited above, and the resulting compound (IIa) or (IIb) as is produced is then hydrolyzed under acidic or alkaline conditions and, if necessary, a protective group is removed, to obtain a desired compound (IIIa) or (IIIb) or (IVa) or (IVb).

45 The optically active cis-2-fluorocyclopropylamine can be synthesized as follows. 2-Fluorocyclopropanecarboxylic acid is reacted with (R)-(+) α -methylbenzylamine to yield N-[1-(R-phenylethyl)]-1,2-cis-fluorocyclopropanecarboxamide. The reaction can be carried out in tetrahydrofuran in the presence of N,N-carbonyldiimidazole. The reaction may also be effected in accordance with a mixed anhydride procedure, in which the carboxylic acid is dissolved in an aprotic solvent and reacted with a halogenoformic ester in the presence of a base at low temperatures and then reacted with the benzylamine to obtain the carboxamide. The resulting carboxamide can be separated into each isomer by chromatographic techniques.

50 The aprotic solvent to be used in the mixed anhydride procedure is not particularly limited and includes ethers, e.g., diethyl ether, diisopropyl ether, tetrahydrofuran, 1,4-dioxane, and 1,2-dimethoxyethane; halogenated hydrocarbons, e.g., dichloromethane, chloroform, 1,2-dichloroethane, and 1,1,2,2-tetrachloroethane; aromatic hydrocarbons, e.g., benzene, toluene, and xylene; and aliphatic hydrocarbons, e.g., pentane, hexane, heptane, and cyclohexane. Commonly employed of them is tetrahydrofuran or chloroform. The water contained in the solvent to be used is usually removed beforehand.

55 The halogen atom in the halogenoformic ester is normally a chlorine atom. The halogenoformic ester

includes methyl, ethyl, 2,2,2-trichloroethyl, phenyl, p-nitrophenyl and benzyl esters.

The base to be used may be either an organic or an inorganic. The inorganic base includes alkali metal hydroxides, carbonates and hydrogencarbonates, e.g., lithium hydroxide, sodium hydroxide, potassium hydroxide, lithium carbonate, sodium carbonate, potassium carbonate, sodium hydrogencarbonate, and 5 potassium hydrogencarbonate. The organic base includes trialkylamines, e.g., triethylamine, tripropylamine, tributylamine, N,N-diisopropylethylamine; dialkylanilines, e.g., diethylaniline and dimethylaniline; and heterocyclic compounds, e.g., N-methylmorpholine, pyridine, and N,N-dimethylaminopyridine.

Separation of the carboxamide into optical isomers can be effected by known techniques, such as silica gel column chromatography under normal pressure or under pressure, preparative thin layer chromatography, and high performance liquid chromatography (HPLC). Separation into optical isomers can also be performed by other separation techniques generally employed, such as recrystallization and reprecipitation.

The thus separated optionally active carboxamide can be led to an optically active cis-2-fluorocyclopropanecarboxylic acid by hydrolysis. The reaction can be carried out by dissolving the carboxamide in, for example, concentrated hydrochloric acid, followed by heating. The hydrochloric acid 15 may be replaced with sulfuric acid or nitric acid. A solvent, such as acetic acid and a lower alcohol, may be used.

The resulting carboxylic acid can be converted at once by Curtius reaction in the presence of a t-butanol to a protected cis-1-(t-butoxycarbonylamino)-2-fluorocyclopropane. The reaction can be carried out conveniently by use of diphenylphosphorylazide, but the synthesis of the intermediate azide compound is 20 not limited thereto, and general methods of synthesis can be applied.

The resulting optically active cis-2-fluorocyclopropylamine derivative can be made use of in obtaining a quinolone derivative having a cis-fluorocyclopropyl group at the 1-position as a single isomer. The quinolone derivative according to the present invention can then be obtained by reacting this isomer with the cyclic amine as described above.

25 The pyridonecarboxylic acid derivatives according to the present invention exhibit potent antimicrobial activity and thus can be used as human and veterinary medicines, fish medicines, agricultural chemicals, and food preservatives.

The dose of the pyridonecarboxylic acid derivatives for use as human medicines ranges from 50 mg to 1 g, preferably from 100 mg to 300 mg, per day for adult. The dose for use as veterinary medicines 30 generally ranges from 1 mg to 200 mg, preferably from 5 mg to 100 mg, per kg of body weight per day, though more or less varying depending on the purpose of administration (therapeutic use or preventive use, etc.), the kind and size of the animal, the kind of pathogenic organisms, and the symptoms. The daily dose recited above may be divided into 2 to 4 doses per day. If necessary, the daily dose may be sometimes deviated from the above-recited range.

35 The pyridonecarboxylic acid derivatives of this invention are active against a wide variety of microorganisms causing various infectious diseases and capable of curing or alleviating and/or preventing the diseases caused by such pathogens.

Illustrative examples of bacteria or bacterium-like microorganisms on which the pyridonecarboxylic acid derivatives of the invention are effective are Staphylococcus sp., Streptococcus pyogenes, Streptococcus 40 Haemolyticus, enterococci, Streptococcus pneumoniae, Peptostreptococcus sp., Neisseria gonorrhoeae, Escherichia coli, Citrobacter sp., Shigella sp., Klebsiella pneumoniae, Enterobacter sp., Serratia sp., Proteus sp., Pseudomonas aeruginosa, Haemophilus influenzae, Acinetobacter sp., Campylobacter sp., and Chlamidias.

45 Examples of diseases caused by these pathogens include folliculitis, furuncle, carbuncle, erysipelas, phlegmon, lymphangitis/lymphadenitis, felon, subcutaneous abscess, spiradenitis, acne conglobata, infectious atheroma, perianal abscess, mastadenitis, superficial secondary infections after trauma, burn or surgery trauma, pharyngolaryngitis, acute bronchitis, tonsillitis, chronic bronchitis, bronchiectasis, diffuse panbronchiolitis, secondary infections of chronic respiratory diseases, pneumonia, pyelonephritis, cystitis, prostatitis, epididymitis, gonococcal urethritis, non-gonococcal urethritis, cholecystitis, cholangitis, bacillary dysentery, enteritis, adnexitis, intrauterine infections, Bartholinitis, blepharitis, hordeolum, dacryocystitis, 50 tarsadenitis, keratoconjunctivitis, otitis media, sinusitis, paradentitis, pericoronitis circumcoronitis, gnathitis, peritonitis, endocarditis, septicemia, meningitis, and skin infectious.

Examples of susceptible microorganisms causing veterinary infectious diseases include those of fowl, such as Escherichia sp., Salmonella sp., Pasteurella sp., Haemophilus sp., Bordetella sp., Staphylococcus sp., and Mycoplasma sp. Specific examples of veneterinary diseases caused by these microorganisms 55 include colibacillosis, pullorum disease, avian paratyphosis, fowl cholera, infectious coryza, staphylococcal infections, and mycoplasmal diseases; those of swin, such as colibacillosis, malmonerosis, pasteurellosis, haemophylus infection, atrophic rhinitis, exudative epidermitis, and mycoplasmal diseases; those for

cattle, such as colibacillosis, salmonellosis, hemorrhagic septicemia, mycoplasmal diseases, bovine contagious pleuroneumonia, and bovine mastitis; those of dogs, such as coliform sepsis, salmonellosis, hemorrhagic septicemia, pyometra, and cystitis; and those of cats, such as hemorrhagic pleuritis, cystitis, chronic rhinitis, haemophilus infection, kitten diarrhea, and mycoplasmal diseases.

5 The compound of the present invention can be formulated into antimicrobial preparations in an appropriate dose form according to administration route selected by the conventional preparation methods. The dose form for oral administration includes tablets, powders, granules, capsules, solutions, syrups, elixirs, and oily or aqueous suspensions. Injections may contain, in addition to the active ingredient, stabilizers, antiseptics, and solubilizing agents. The solution which may contain such excipients is put in a
10 container and further, the solution may be subjected to lyophilization or the like means to prepare solid preparations which can be dissolved on use. The container may contain either a single dose or several doses.

Dose forms for external administration include solutions, suspensions, emulsions, ointments, gels, creams, lotions, and sprays.

15 In the preparation of solid preparations, the active ingredient may be mixed with appropriately selected pharmaceutically acceptable excipients, such as fillers, extenders, binders, disintegrators, dissolution accelerators, wetting agents, and lubricants.

Liquid preparations include solutions, suspensions, and emulsions. They may contain excipients, such as suspension stabilizers and emulsifiers.

20 The compound of the present invention can be administered to animals orally either directly or as admixed to feedstuff, or its solution may be given either directly or as admixed to water or feedstuff. The compound may also be administered non-orally by, for example, injection.

The compound of the invention can be formulated into preparations for animals, such as powders, fine granules, solubilized powders, syrups, solutions, and injections, by commonly employed preparation
25 methods.

Formulation Examples are given below for illustrative purposes only but not for limitation.

FORMULATION EXAMPLE 1		
	Capsule:	
30	Compound of Example 8	100.0 mg
	Corn starch	23.0 mg
	Calcium carboxymethyl cellulose	22.5 mg
35	Hydroxypropylmethyl cellulose	3.0 mg
	Magnesium stearate	1.5 mg
	total:	<u>150.0 mg</u>

FORMULATION EXAMPLE 2		
	Solution:	
40	Compound of Example 7	1 to 10 g
	Acetic acid or sodium hydroxide	0.5 to 2 g
45	Ethyl p-hydroxybenzoate	0.1 g
	Purified water	<u>88.9 to 98.4 g</u>
	total:	<u>100 g</u>

50

55

FORMULATION EXAMPLE 3	
Powder for Admixture with Feedstuff:	
Compound of Example 6	1 to 10 g
Corn starch	98.5 to 98.5 g
Light anhydrous silicic acid total:	0.5 g 100 g

5

The present invention is now illustrated in greater detail by way of the following Examples and Reference Examples, but it should be understood that the present invention is not deemed to be limited thereto. Reference Examples describe the syntheses of optically active skeletons from an optically active cis-2-fluorocyclopropanecarboxylic acid.

10

Antimicrobial activity of the optically active compounds prepared in Examples was evaluated in accordance with the standard method specified by Nippon Kagakuryoho gakkai, and results obtained are shown in Table 1 below in terms of minimum Inhibitory concentration (MIC: $\mu\text{g./m}^2$).

20

REFERENCE EXAMPLE 1

25

N-[1-(R)-Phenylethyl]-1,2-cis-2-fluorocyclopropanecarboxamide (2a, 2b):

1-1. Carbonyldiimidazole Method:

One gram of cis-2-fluorocyclopropanecarboxylic acid was dissolved in 30 ml of tetrahydrofuran (THF), and 1.78 g of N,N'-carbonyldiimidazole was added thereto, and the mixture was stirred at room temperature for 1 hour. To the solution was added 1.45 g of (R)-(+)- α -methylbenzylamine, and the stirring was continued for 2 hours. The solvent was removed under reduced pressure, and the residue was extracted with chloroform. The extract was washed successively with a 10% citric acid aqueous solution and water and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure. From the residual viscous oily substance, each stereoisomer was isolated by HPLC under conditions shown below. Each isomer was recrystallized from diisopropyl ether to yield the titled compound (2a) or (2b). HPLC Conditions:

Column: Nucleosil 50-5 (20 mm ID x 250 mm L) (senshu Pack SSC Silica, 782-IN, produced by Senshu Kagaku)

Solvent: ethyl acetate-THF (9:1 by volume)

Flow Rate: 9.0 ml/min

Retention Time: 11 mins. for Compound (2a)

13 mins. for Compound (2b)

15 1-2. Mixed Anhydride Method:

In 50 ml of THF were dissolved 4.19 g of 2-fluorocyclopropanecarboxylic acid (cis-trans mixture) and 4.07 g of triethylamine, and the solution was cooled to -10 °C. To this was added a solution of 4.73 g of ethyl chloroformate in 20 ml of THF and the mixture was stirred for 10 minutes. To the solution was then added dropwise a solution of 4.88 g of (R)-(+)-α-methylbenzylamine in 30 ml of THF at that temperature, and the mixture was stirred at room temperature for 15 hours. The solvent was removed under reduced pressure, and the residue was extracted with benzene. The extract was washed successively with a 10% citric acid aqueous solution, a 1N sodium hydroxide aqueous solution and water and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the resulting pale yellow oily substance was purified by silica gel column chromatography using a mixed solvent of benzene and ethyl acetate as an eluent to each of the titled compounds (2a) and (2b).

REFERENCE EXAMPLE 2

30

(+)-cis-2-Fluorocyclopropanecarboxylic acid (3a):

35 In 15 ml of concentrated hydrochloric acid was dissolved 530 mg of the amide compound (2a) as prepared in Reference Example 1, and the solution was heated at 100 to 110 °C for 5 hours while stirring. To the reaction mixture was added 20 ml of water, and the mixture was extracted with ethyl acetate. The extract was then extracted with a sodium hydrogencarbonate aqueous solution and this aqueous extract was washed with ethyl acetate. The aqueous extract was adjusted to a pH of 5 with concentrated hydrochloric acid and extracted with ethyl acetate. The extract was dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure to yield the titled compound (3a) as a pale yellow oil.

40

REFERENCE EXAMPLE 645 (-)-Ethyl-2-[(1,2-cis-2-fluorocyclopropan-1-yl)aminomethylene]-3-oxo-3-(2,4,5-trifluorophenyl)propionate (5a):

Ethyl 2,4,5-trifluorobenzoylacetate (234 mg), 2 ml of ethyl orthoformate, and 4 ml of acetic anhydride were mixed and the mixture was heated at 110 to 120°C for 2 hours while stirring. The solvent was removed under reduced pressure, and the residue was dissolved in 10 ml of dichloromethane.

Compound (4a) as obtained in Reference Example 4 (167 mg) and 5 ml of trifluoroacetic acid were 50 mixed and the mixture was stirred at room temperature for 20 minutes and concentrated to dryness under reduced pressure (the resulting amine trifluoroacetate was used without purification). The residue was dissolved in 10 ml of dichloromethane and cooled to -10°C . A solution of 230 mg of triethylamine in 10 ml of dichloromethane was added dropwise thereto. Thereafter, the above prepared dichloromethane solution was added dropwise to the mixture, followed by stirring at room temperature over-night. The solvent was 55 evaporated to dryness under reduced pressure, and the residue was subjected to silica gel column chromatography using a mixed solvent of benzene and ethyl acetate (2:1 by volume). A yellow oily substance was obtained from the eluent after the removal of the solvent. The product was recrystallized from diisopropyl ether-n-hexane to yield the titled compound (5a) as a colorless crystals.

Melting Point: 69-70 °C
 $[\alpha]_D$: -10.29 (c = 1.088, chloroform)

5

REFERENCE EXAMPLE 7

(+)-Ethyl-2-[(1,2-cis-2-fluorocyclopropan-1-yl)aminomethylene]-3-oxo-3-(2,4,5-trifluorophenyl)propionate (5b):

Ethyl 2,4,5-trifluorobenzoylacetate (337 mg), 2 ml of ethyl orthoformate, and 4 ml of acetic anhydride were mixed, and the mixture was heated at 110 to 120 °C for 2 hours while stirring. The solvent was removed under reduced pressure, and the residue was dissolved in 10 ml of dichloromethane.

Compound (4b) as obtained in reference Example 5 (240 mg) and 5 ml of trifluoroacetic acid were mixed and the mixture was stirred at room temperature for 1 hour, followed by concentration under reduced pressure (the amine trifluoroacetate was used without purification). The residue was dissolved in 10 ml of dichloroethane, and the solution was cooled to -10 °C. A solution of 230 mg of triethylamine in 10 ml of dichloromethane was added thereto dropwise, and the above-prepared dichloromethane solution was further added to the mixture, followed by stirring at room temperature over-night. The solvent was removed under reduced pressure, and the residue was subjected to silica gel column chromatography using a mixed solvent of benzene and ethyl acetate (2:1 by volume). A yellow oily substance was obtained from the eluent after the removal of solvent. Recrystallization from diisopropyl ether-n-hexane gave the titled compound (5b) as a colorless crystal.

Melting Point: 69-70 °C
 $[\alpha]_D$: +12.09 (c = 0.645, chloroform)

30

REFERENCE EXAMPLE 8

(+)-6,7-Difluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylate (6a):

In 15 ml of anhydrous dioxane was dissolved 180 mg of Compound (5a) as obtained in Reference Example 6, and 200 mg of 60% sodium hydride was added to the solution, followed by stirring at room temperature for 2 days. The reaction mixture was added to a 10% citric acid aqueous solution, followed by concentration under reduced pressure. The residue was extracted with chloroform, and the extract was dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure. The residue was purified by silica gel preparative TLC using benzene-ethyl acetate (1:2 by volume) as a developing solvent to yield the titled compound (6a) as a colorless crystal.

(+)-5-Amino-7-[3-(S)-amino-1-pyrrolidinyl]-6,8-difluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (18b):

55

Five milliliters of trifluoroacetic acid was cooled with ice, and 230 mg of 3-(S)-1-t-butoxycarbonyl-3-(t-butoxycarbonylamino)pyrrolidine was dissolved therein, followed by stirring at room temperature for 30 minutes. The reaction mixture was evaporated to dryness under reduced pressure, and the residue was dissolved in 25 ml of acetonitrile. To the solution were added 160 mg of the carboxylic acid (17b) and 400 mg of triethylamine, and the mixture was heated under reflux for 12 hours. The reaction mixture was evaporated to dryness under reduced pressure, and 1N hydrochloric acid was added to the residue. After washing the mixture with chloroform, the aqueous layer was adjusted to a pH of 12 with a 1N sodium

hydroxide aqueous solution, followed by washing with chloroform. The aqueous layer was then adjusted to a pH of 7.6 with hydrochloric acid, followed by extraction with chloroform. The extract was dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The residue was recrystallized from aqueous ammonia-ethanol to obtain 68 mg of the titled compound (18b) as a colorless crystal.

Melting Point: 214-217 °C

$[\alpha]_D$: +31.3 (c = 0.268, 0.1N NaOH aqueous solution)

Synthesis of Optically Active 7-Amino-5-azaspiro-[2.4]heptane:

1) 5-[(1R)-Phenylethyl]-4,7-dioxo-5-azaspiro[2,4]heptane (19):

30

To 10.4 g of ethyl acetoacetate were added 15 g of 1,2-dibromoethane, 23 g of potassium carbonate, and 150 ml of N,N-dimethylformamide (DMF), and the mixture was stirred at room temperature for 2 days. Any insoluble matter was removed by filtration, and the filtrate was evaporated to dryness under reduced pressure. To the residue was added water, and the mixture was extracted with chloroform. The chloroform extract was dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The resulting pale yellow oily substance was subjected to distillation under reduced pressure to obtain 7.5 g of ethyl 1-acetyl-1-cyclopropanecarboxylate having a boiling point of 70 to 71 °C/2 to 3 mmHg.

1H -NMR (CDCl₃) δ ppm:

1.30 (3H, t, J = 7Hz), 1.48 (4H, s), 2.49 (3H, s), 4.24 (2H, q, J = 7Hz)

40

In 200 ml of ethanol was dissolved 35.7 g of the above obtained compound, and 40 g of bromine was added dropwise to the solution at room temperature while stirring. After the stirring was continued at room temperature for 2 hours, the excess bromine and the solvent were removed under reduced pressure to obtain ethyl 1-bromoacetyl-1-cyclopropanecarboxylate, which was then, without further purification, dissolved in 200 ml of ethanol. To the solution were simultaneously added dropwise 33 g of R-(+)-1-phenylethylamine and 27 g of triethylamine over a period of 1 hour while stirring under ice-cooling. After the addition, the reaction temperature was raised to room temperature, and the stirring was continued at room temperature for 2 days. Any insoluble matter was removed by filtration, and ethanol was removed from the filtrate under reduced pressure. The residue was dissolved in 300 ml of ethyl acetate, and the solution was washed successively with 1N hydrochloric acid, a saturated sodium hydrogencarbonate aqueous solution, and a saturated sodium chloride aqueous solution in this order. The organic layer was dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The residue was subjected to 200 g of silica gel column which was eluted with 0 to 2% methanolic chloroform to obtain the titled compound (19) as a colorless crystal.

Melting Point: 98-103 °C

1H -NMR (CDCl₃) δ ppm:

1.62 (3H, d, J = 7.2Hz), 3.5 (1H, d, J = 18Hz), 3.9 (1H, d, J = 18Hz), 5.82 (1H, q, J = 7.2Hz), 7.36 (5H, s)

55

2) 5-[(1R)-Phenylethyl]-7-hydroxyimino-4-oxo-5-azaspiro[2,4]heptane (20):

To 3.35 g of Compound (19) were added 1.6 g of hydroxylamine hydrochloride, 2.3 g of triethylamine, and 80 ml of ethanol, and the mixture was stirred at room temperature for 2 hours. The solvent was removed under reduced pressure, and chloroform was added to the residue. The mixture was washed successively with a 10% citric acid aqueous solution and a saturated sodium chloride aqueous solution. The 5 organic layer was dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure to obtain 3.5 g of the titled compound (20) as a colorless crystal.

Melting Point: 188-194 °C

¹H-NMR (CDCl₃) δ ppm:
1.2-1.4 (2H, m), 1.53 (3H, d, J = 7.2Hz & 2H, m), 3.8 (1H, d, J = 18Hz), 4.16 (1H, d, J = 18Hz), 5.63 (1H, q, 10 J = 7.2Hz), 7.32 (5H, s)

3) 7-Amino-4-oxo-5-[(1R)-Phenylethyl]-5-azaspiro[2.4]heptane (21a, 21b):

To 150 ml of methanol were added 3.5 g of Compound (20) and 7.5 ml of Raney nickel, and catalytic reduction was carried out at room temperature for 12 hours. After the catalyst was removed by filtration, the solvent was removed from the filtrate under reduced pressure. The residue was subjected to a 100 g of silica gel column eluted with a mixed solvent of 5% methanol/chloroform which was to yield 1.0 g of the entitled compound (21b) from the earlier fraction and 0.8 g of the titled compound (21a) from the later 20 fraction each as a colorless oily substance.

Compound (21b):

¹H-NMR (CDCl₃) δ ppm:
0.8-1.4 (4H, m), 1.52 (3H, d, J = 7Hz), 2.87 (1H, dd, J = 10, & 3Hz), 3.3-3.9 (2H, m), 4.27 (2H, br. s), 5.42 (1H, q, J = 7Hz), 7.29 (5H, s)

Compound (21a):

¹H-NMR (CDCl₃) δ ppm:

35 4) 7-Amino-5-[(1R)-Phenylethyl]-5-azaspiro[2.4]heptane (22a, 22b):

To 50 ml of anhydrous tetrahydrofuran were added 1.0 g of Compound (21b) and 500 mg of lithium aluminum hydride, and the mixture was refluxed for 17 hours. After cooling, 0.5 ml of water, 0.5 ml of a 15% sodium hydroxide aqueous solution, and 1.5 ml of water were successively added to the reaction 40 mixture in this order, followed by stirring well at room temperature for 30 minutes. Any insoluble matter was removed by filtration and thoroughly washed with tetrahydrofuran. The filtrate and the washing were combined and dried. The solvent was removed under reduced pressure to obtain 940 mg of the titled compound (22b) as a pale yellow oily substance. In the same manner, 755 mg of the titled compound (22a) was obtained from 800 mg of Compound (21a).

45

Compound (21b):

¹H-NMR (CDCl₃) δ ppm:
0.2-0.8 (4H, m), 1.35 (3H, d, J = 6.6Hz), 1.6-2.0 (2H, br. m), 2.2-3.1 (4H, m), 3.24 (1H, q, J = 6.6Hz), 3.5-3.9 (1H, m), 7.28 (5H, br. s)

Compound (22a):

5) 7-(t-Butoxycarbonylamino)-5-[(1R)-phenylethyl]-5-azaspiro[2,4]heptane (23a, 23b):

To 20 ml of anhydrous tetrahydrofuran were added 764 mg of Compound (22b) and 1.3 g of Boc-ON [Boc-ON; 2-(t-Butoxycarbonyloxyimino)-2-phenylacetonitrile

5

10

and the mixture was stirred at room temperature for 4 hours. Ethyl acetate was added to the reaction mixture, and the mixture was washed twice with a 1N sodium hydroxide aqueous solution and then once with water, followed by extraction with a 10% citric acid aqueous solution. The aqueous extract was washed once with ethyl acetate, and a 15% sodium hydroxide aqueous solution was added to the aqueous layer under cooling to make it alkaline. The mixture was extracted three times with chloroform, and the organic layer was washed with a saturated sodium chloride aqueous solution and then dried. The solvent was removed under reduced pressure, and the residue was subjected to silica gel column chromatography (silica gel: 20 g; eluent: chloroform:methanol = 20:1, 10:1) to obtain 690 mg of the titled compound (23b). This compound was allowed to stand to crystallize, followed by washing with n-hexane. The titled compound (23a) was obtained in the same manner.

55 6) 7-t-Butoxycarbonylamino-5-azaspiro[2,4]heptane (24a, 24b)

To 30 ml of ethanol were added 650 mg of Compound (23b) and 500 mg of 50% hydrated palladium-on-carbon, and catalytic reduction was effected under heating at a pressure of 4.2 atoms. After 6 hours, the

catalyst was removed by filtration, and the solvent was removed under reduced pressure. To the oily residue was added ethyl acetate, followed by extracting twice with a 10% citric acid aqueous solution. The aqueous extract was made alkaline with a 15% sodium hydroxide aqueous solution and then extracted three times with chloroform. The chloroform layer was washed with water and dried. The solvent was removed under reduced pressure to yield 440 mg of the titled compound (24b) as a crude product. The titled compound (24a) was obtained in the same manner as above. The NMR spectra of Compounds 24b) and (24a) were in complete agreement with each other.

10 Compound (24)

15

EXAMPLE 920 7-(7-t-Butoxycarbonylamino-5-azaspiro[2.4]heptan-5-yl)-8-chloro-6-fluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-1,4-dihydro-4-oxoquinoline-3-carboxylic acid (25bb):

In 0.6 ml of acetonitrile were dissolved 160 mg of 8-chloro-6,7-difluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-1,4-dihydro-4-oxoquinoline-3-carboxylic acid (12b), 150 mg of the amine compound (24b), and 0.5 ml of triethylamine, and the solution was heated under reflux for 5 hours. After cooling, the precipitated colorless crystals were collected by filtration. The solvent of the mother liquor was removed under reduced pressure, and the residue was purified by silica gel preparative TLC using a developing solvent of chloroform-methanol (5:1 by volume). The purified product and the above-obtained crystals were combined to give 255 mg of the titled compound (25bb).

30 Melting Point: 213-218 °C

'H-NMR (CDCl₃) δ ppm:

0.6-1.0 (6H, m), 1.45 (9H, s), 7.99 (1H, d, J = 13.1Hz), 8.74, 8.78 (each 0.5H, s)

35

EXAMPLE 1040 (-)-7-(7-Amino-5-azaspiro[2.4]heptan-5-yl)-8-chloro-6-fluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-1,4-dihydro-4-oxoquinoline-3-carboxylic acid (26bb):

To 255 mg of the Boc-compound (25bb) as obtained in Example 9 were added 0.5 ml of anisole and 10 ml of trifluoroacetic acid under ice-cooling. After warming to room temperature, the mixture was stirred for 30 minutes. The solvent was removed under reduced pressure, a 1N sodium hydroxide aqueous solution was added to the residue adjusting a pH of 11 to 12. The alkaline aqueous solution was washed twice with chloroform. The aqueous layer was adjusted to a pH of about 7 with concentrated hydrochloric acid and a 10% citric acid aqueous solution and extracted three times with chloroform. The extract was washed with water and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the resulting solid was recrystallized from ethanol-concentrated aqueous ammonia to obtain 142 mg of the titled compound (26bb) as a colorless crystal.

REFERENCE EXAMPLE 27

(-) -Ethyl 8-chloro-7-fluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylate (29a)

A mixture of 1 g of ethyl 2,6-dichloro-5-fluoronicotinoylacetate (27), 3 ml of ethyl orthoformate, and 6 ml of acetic anhydride was heated at 120 °C for 1 hour while stirring. The reaction mixture was evaporated to dryness under reduced pressure, and the residue was dissolved in 10 ml of dichloromethane.

Ten milliliters of trifluoroacetic acid was cooled with ice, and 750 mg of (+)-cis-1-(t-butoxycarbonylamino)-2-fluorocyclopropane (4a) was dissolved therein. The solution was stirred at room temperature for 20 minutes, followed by evaporation to dryness under reduced pressure. The residue was suspended in 20 ml of dichloromethane, and 2.0 g of triethylamine was added thereto under ice-cooling. To the suspension was further added the above-prepared dichloromethane solution, followed by stirring at room temperature for 30 minutes.

The reaction mixture was washed with water and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure. The residue was subjected to column chromatography using 50 g of silica gel using chloroform as an eluent to yield 1.29 g of ethyl 2-(2,6-dichloro-5-fluoronicotinoyl)-3-(1,2-cis-2-fluoro-1-cyclopropyl)acrylate (28a) as a colorless oil.

¹H-NMR (CDCl₃) δ ppm:

15 (-)-7-[3-(R)-[1-(S)-Aminoethyl]-1-pyrrolidinyl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (34b):

20 A mixture of 159 mg of (-)-8-chloro-6,7-difluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (12b), 160 mg of 3-(R)-[1-(S)-t-butoxycarbonylaminoethyl]pyrrolidine (cf. JP-A-61-311992), 400 mg of triethylamine, and 20 ml of acetonitrile was heated under reflux for 12 hours. The reaction mixture was concentrated under reduced pressure, and the residue was dissolved in chloroform. The organic solution was washed successively with a 10% citric acid aqueous solution and water, and dried over anhydrous sodium sulfate. The solvent was evaporated, and the residue was recrystallized from ethyl acetate/isopropyl ether to yield 220 mg of (-)-7-[3-(R)-[1-(S)-t-butoxycarbonylaminoethyl]-1-pyrrolidinyl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (33b).

REFERENCE EXAMPLE 31

55 Ethyl 2-(3-acetoxy-2,4,5-trifluorobenzoyl)-3-(1,2-cis-2-fluoro-1-cyclopropyl)acrylate (36b):

A mixture of 1.0 g of ethyl 3-acetoxy-2,4,5-trifluorobenzoylacetate (35) (cf. JP-A-87-175485), 6 ml of ethyl orthoformate, and 6 ml of acetic anhydride was heated at 120 °C for 3 hours under stirring. The

reaction mixture was evaporated to dryness under reduced pressure, and the residue was dissolved in 10 ml of dichloromethane.

In 5 ml of trifluoroacetic acid was dissolved 467 mg of (-)-cis-1-t-butoxycarbonylamino-2-fluorocyclopropane (4b), and the solution was stirred for 20 minutes, followed by evaporation to dryness under reduced pressure. The residue was suspended in 20 ml of dichloromethane, and 5 ml of a dichloromethane solution containing 500 mg of triethylamine was added dropwise thereto under ice-cooling, followed by stirring for 10 minutes. To the solution was added the above-prepared dichloromethane solution, and the mixture was stirred at room temperature for 16 hours. The reaction mixture was washed successively with a 10% citric acid aqueous solution and water. The organic layer was dried over anhydrous sodium sulfate, followed by evaporation under reduced pressure to obtain 1.25 g of the titled compound (36b).

(-)-Ethyl 6,7-difluoro-1-(1,2-cis-2-fluoro-1-cyclopropyl)-8-methoxy-4-oxo-1,4-dihydroquinoline-3-carboxylate
(37b):

20

In 40 ml of dioxane was dissolved 1.25 g of Compound (36b), and 440 mg of potassium carbonate and 10 ml of water were added thereto, followed by stirring at room temperature for 19 hours. The reaction mixture was neutralized with hydrochloric acid, concentrated under reduced pressure, and extracted with chloroform. The extract was dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The residue was dissolved in 40 ml of anhydrous dioxane, and 300 mg of 60% sodium hydride and 1 ml of ethyl iodide were added thereto, followed by stirring at room temperature for 24 hours. The reaction mixture was concentrated under reduced pressure, and the residue was extracted with chloroform, washed with water, and dried over anhydrous sodium sulfate. The solvent was evaporated. The residue was recrystallized from isopropyl ether to obtain 235 mg of the titled compound (37b) as a colorless crystal.

(±)-cis-4-Amino-1-benzyl-3-methyl-2-oxopyrrolidine (45):

50

A mixture of 5.13 g of ethyl 1-benzyl-3-methyl-2-oxo-3-pyrrolidinocarboxylate (42, cf. JP-A-62-4284), 40 ml of 50% ethanol, and 2 g of sodium hydroxide was stirred at room temperature for 42 hours. To the reaction mixture was added 100 ml of water, and the mixture was washed with chloroform. The aqueous layer was neutralized with hydrochloric acid, extracted with ethyl acetate. The extract was dried over anhydrous sodium sulfate. The solvent was evaporated to obtain 3.40 g of (±)-1-benzyl-2-oxo-3-pyrrolidinocarboxylic acid (43) as a colorless crystal.

55

Compound (43) (3.40 g), 4.45 g of diphenylphosphorylazide, 1.9 g of triethylamine, and 50 ml of t-butyl alcohol were mixed and the mixture was heated under reflux for 12 hours. The reaction mixture was concentrated under reduced pressure, and the residue was dissolved in chloroform. The solution was

washed successively with a 10% citric acid aqueous solution, a 2% sodium hydroxide aqueous solution, and water and dried over anhydrous sodium sulfate. The solvent was evaporated, and the residue was purified by silica gel column chromatography using chloroform-methanol (97.5:2.5 by volume) as an eluent to obtain 1.76 g of (\pm)-cis-1-benzyl-4-t-butoxycarbonylamino-3-methyl-4-oxopyrrolidine (44) as a colorless oil.

In 15 ml of trifluoroacetic acid was dissolved 1.76 g of Compound (44). After 1 hour, the solution was concentrated under reduced pressure. To the residue was added 100 ml of water, and the mixture was washed with benzene. The aqueous layer was adjusted to a pH of 12 with sodium hydroxide and extracted with chloroform. The organic layer was dried over anhydrous sodium sulfate, and the solvent was evaporated to obtain the titled compound (45) as a colorless oil.

REFERENCE EXAMPLE 33-3

(+)-cis-1-Benzyl-3-t-butoxycarbonylamino-4-methylpyrrolidine (47a):

50 A mixture of 3.23 g of Compound (46a) and 50 ml of concentrated hydrochloric acid was heated under reflux for 5 hours, followed by concentration under reduced pressure. To the residue was added a 1N sodium hydroxide aqueous solution, and the solution was extracted with chloroform. The organic layer was dried over anhydrous sodium sulfate, and the solvent was evaporated to obtain 1.48 g of Compound (45a) as a colorless oil.

The product was dissolved in 10 ml of tetrahydrofuran, and the solution was added dropwise to a suspension of 2.0 g of lithium aluminum hydride in 50 ml of tetrahydrofuran. The mixture was heated under reflux for 24 hours. To the reaction mixture was added dropwise 10 ml of water under ice-cooling, and, after

stirring for 30 minutes, any insoluble matter was removed by filtration. To the filtrate was added 1.92 g of Boc-ON, followed by stirring for 24 hours. The reaction mixture was concentrated under reduced pressure, and the residue was extracted with chloroform. The extract was washed successively with a 5% sodium hydroxide aqueous solution and water, and dried over anhydrous sodium sulfate. The solvent was then evaporated.

The residue was purified by silica gel column chromatography using chloroform-methanol (1:0 to 9:1 by volume) as an eluent to obtain 1.76 g of a crystal. To the product was added n-hexane, and the mixture was stirred thereby precipitating a d₁ compound. The crystals were collected by filtration, and the filtrate was concentrated. This procedure was repeated twice. One hundred milligrams of the d₁ compound was obtained from the filter cake and 1.61 g of the titled optically active compound (47a) from the mother liquor.

Melting Point: 48-52 °C

Claims

- 55 1. An N₁-(1,2-cis-2-halogenocyclopropyl)-substituted pyridonecarboxylic acid derivative represented by formula (I):

10

wherein R¹ represents a substituted or unsubstituted amino group, a hydroxyl group, a thiol group, or a hydrogen atom; R² represents a substituted or unsubstituted cyclic amino group which may contain at least one hetero atom selected from a nitrogen atom, an oxygen atom and a sulfur atom in its ring; A represents C-X³ or a nitrogen atom; X¹ and X², which may be the same or different, each represents a halogen atom; and X³ represents a halogen atom, an alkyl group having from 1 to 6 carbon atoms, an alkoxy group having from 1 to 6 carbon atoms; a cyano group, a trifluoromethyl group, or a hydrogen atom; provided that the case wherein R¹ is a hydrogen atom and R² is a piperazine or 4-alkyl- substituted piperazine residue is excluded, or a salt thereof.

20 2. A compound as claimed in claim 1, wherein R² is a 4- to 7-membered cyclic amino group which may be substituted with a hydroxyl group, an alkyl group having from 1 to 6 carbon atoms, or a substituted or unsubstituted amino group; or a salt thereof.

3. A compound as claimed in claim 1, wherein R² is a pyrrolidone, piperidine, piperazine, diazabicycloheptane or diazabicyclooctane residue; or a salt thereof.

25 4. A compound as claimed in claim 1, wherein R² is a cyclic amino group comprising a single stereoisomer; or a salt thereof.

5. A compound as claimed in claim 4, wherein R² is a 3-aminopyrrolidinyl group; or a salt thereof.

6. A compound as claimed in claim 4, wherein R² is a 7-amino-5-azaspiro[2.4]heptan-5-yl group; or a salt thereof.

30 7. A compound as claimed in claim 1, wherein X² is a fluorine atom.

8. A compound as claimed in claim 1, wherein said compound is 7-[3-(S)-amino-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[3-(S)-amino-1-pyrrolidinyl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[7-amino-5-azaspiro[2.4]heptan-5-yl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 5-amino-7-[3-(S)-amino-1-pyrrolidinyl]-6,8-difluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[4-(S)-amino-2-(S)-methyl-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid, 7-[3-(R)-[1-(S)-aminoethyl]-1-pyrrolidinyl]-8-chloro-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[3-amino-4-methyl-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-8-methoxy-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 7-[4-(S)-amino-2-(S)-methyl-1-pyrrolidinyl]-6-fluoro-1-(1,2-cis-2-fluorocyclopropyl)-8-methyl-4-oxo-1,4-dihydroquinoline-3-carboxylic acid, 5-amino-7-[7-amino-5-azaspiro[2.4]heptane-5-yl]-6,8-difluoro-1-(1,2-cis-2-fluorocyclopropyl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid; or a salt thereof.

40 9. An antibacterial agent comprising, as an active ingredient, at least one N₁-(1,2-cis-2-halogenocyclopropyl)-substituted pyridonecarboxylic acid derivative represented by formula (I) or a salt thereof as claimed in claim 1.

(54) Optically active pyridonecarboxylic acid derivatives.

(57) N₁-(1,2-cis-2-halogenocyclopropyl)-substituted pyridonecarboxylic acid derivatives represented by formula (I) and the salts thereof are disclosed. These compounds have patent antibacterial activities against a wide variety of infectious bacteria, and are useful as antibacterial agents by oral or parenteral administration.
